PROFILE SUMMARY

four-year Electrical Engineering student at Telkom University with proven software engineering experience spanning full-stack web development, cross-platform mobile applications, and 3D systems. Proficient in TypeScript/JavaScript, React, C#, PHP, and Python. Experienced in building production RESTful APIs, client-side GPU-accelerated pipelines, Capacitor-based Android apps, and physics-driven game architectures. Demonstrated track record in an industry internship and lab R&D. Seeking a Software Engineering Intern position to build scalable, high-impact software products.

EDUCATION

Telkom University – Bandung, IndonesiaAugust 2023 – Present
Bachelor of Electrical Engineering | *Current Student*

- Relevant Coursework: Object-Oriented Programming, Data Structures & Algorithms, Control Systems, Microprocessors, Digital Signal Processing, Big Data Analytics.

TECHNICAL SKILLS

- **Programming Languages:** TypeScript, JavaScript, C#, PHP, Python, C/C++
- **Frontend & Mobile:** React, Next.js/Vite, Capacitor (Android), Flutter Web
- **Backend & Databases:** RESTful APIs, PHP, PostgreSQL, Docker Compose, Nginx, SQLite
- **Systems & Game Tech:** Unity Engine (Unity 6), 3D Kinematics/Vector Math, Finite State Machines (FSM)
- **Developer Tools:** Git, Postman, Linux/Bash, Unity Editor Scripting API, VS Code, PlatformIO

PROFESSIONAL & INDUSTRY EXPERIENCES

PT. Pilar Timur Teknologi (Digital Oasis) – Bandung, IndonesiaJune 2026 – July 2026
Software Engineer Intern / Full Stack Developer | GitHub: https://github.com/reinh20/Web_IKA_JTK-

- Developed the centralized IKA JTK alumni platform encompassing a PHP REST API, React/TypeScript CMS Admin, and Flutter Web portal integrated with PostgreSQL.
- Engineered a full-stack E-Voting system featuring 15-second asynchronous HTTP polling for live vote tracking, automated schedule locking, and concurrency protection ensuring 1-account-1-vote integrity.
- Implemented client-side image downscaling utilizing Flutter Skia GPU acceleration and HTML5 Canvas, reducing high-res uploads from up to 50MB to <5MB to dramatically optimize server bandwidth and prevent latency spikes.
- Hardened RESTful API security by implementing standardized error masking and controller-level catch-block logging, preventing sensitive server stack-trace exposure.

Multimedia Applications, Big Data and Cybersecurity Laboratory (MBC Lab) October 2024 – Present
Research Assistant (Game Tech Division) | Bandung, Indonesia

- Led software prototyping within the Game Tech division, architecting reusable gameplay modules in C#/Unity.
- Formulated technical documentation, architecture decision records, and clean-code standards for cross-functional teams.

FEATURED TECHNICAL PROJECTS

SmartKey Gait Analysis – Android Mobile Application 2025
Mobile Frontend Engineer | *React, TypeScript, Capacitor* | *GitHub: github.com/reinh20/SmartKey-App*

- Built a cross-platform Android application using React, TypeScript, Vite, and Capacitor for hardware-connected smart keys.
- Architected responsive UI layouts, touch interaction controls, and telemetry dashboard panels using TailwindCSS and Radix UI.
- Implemented Bluetooth Low Energy (BLE) pairing workflows via Capacitor Community BLE and local SQLite caching for reliable offline state persistence (client-side interface layer; ML models excluded).

WHAT IS UP THERE – 3D Physics Platformer & Hazard Simulation October 2024
Gameplay & Systems Programmer | *Unity 6, C#* | *GitHub: github.com/reinh20/WHAT-IS-UP-THERE*

- Architected a 3D kinematic character controller in C# with vector dot products, raycast normal projection, dynamic wall-running, and directional momentum preservation.
- Engineered an interactive grappling hook using SpringJoint physics (Hooke's Law simulation) paired with a SphereCast-based 3D aim-assist algorithm.
- Implemented autonomous AI hazards using Finite State Machines (FSM), line-of-sight raycasting, and custom Unity Editor tooling for automated scene lighting and prefab setup.

IoT- and AI-Based DC Motor Monitoring System 2024
Embedded & Software Developer

- Engineered an IoT telemetry pipeline on ESP32 microcontrollers using dual-layer networking (ESP-NOW & MQTT).
- Developed a real-time Graphical User Interface (GUI) visualizing multi-threaded telemetry data (RPM, current, voltage).

CERTIFICATIONS & ACTIVITIES

- Google Data Analysis with Python Specialization | Google AI Professional Training (2026)
- Event Division Lead Digital Learning MBC Lab (DIGILEARN) | KSR PMI Red Cross Volunteer (2024 – Present)
